Re: 700 MHz Wireless Auction

Hello Ron:

I hope this finds you well and that you had a good break for Christmas with the family.

This week, the auction by the Canadian Government for the 700 MHz frequency range started and technical information is required for the building construction community as well as municipalities.

Can you please have the Prime Minister's Office or Industry Canada forward the applicable documentation from Canadian Professional Engineers signing off on the 700 MHz frequencies as it pertains to buildings or infrastructure interaction? We require that information for design, consultation and compliance with building codes. Engineers are insured for errors or omissions and the reason for the importance of the documentation as soon as possible.

Media is reporting the benefits of the frequencies is the high penetration of buildings or parkades so people will not get dropped calls. Buildings are specifically designed for their intended use and the frequencies going through buildings has to be addressed in design.

Thanks in advance.

Sincerely,

Curtis Bennett
